Dr. Francine shares her perspective on the impact of Conquer Cancer grants and the importance of early detection in Africa.

In many African regions, patients like Abigail live in remote conditions, often traveling for hours or days and facing long waits for treatment in crowded hospitals. The scale of the challenges is enormous, with barriers to care in their home country.

"Early detection likely would have saved my dad's life, or at least extended it a little bit longer," Liz says. "It's so important to bring awareness to this and get people to participate in routine screenings."
